

The Longleaf Pine Ecosystem: An Assessment of Current Conditions

Kenneth W. Outcalt

and

Patricia A. Outcalt

September 1994

PREFACE

This document is based on information gathered by the Forest Inventory and Analysis units of the Southeastern and Southern Forest Experiment Stations, USDA Forest Service. The considerable contribution to this report made by Noel Cost, John Kelly, and Larry Westrick of these units, who supplied the overall distribution map and the data for the figures, is gratefully acknowledged. Data from sample plots were used to estimate the total amount of longleaf pine left in the Southern United States. Because of the cycle of inventory across states, data is from 2 to 6 years old. The sampling intensity varies somewhat from state to state but each sample plot represents about 3100 acres. For a detailed explanation of plot location and sampling see Hansen and others (1992).

Figures in this document were created by Patricia A. Outcalt.

The cover photo is the Wade property located near Thomasville, GA and is courtesy of Tall Timbers Research Station located in Tallahassee, FL.
